METHODOLOGY & LIMITATIONS

This backtest applies the current regime classification model retroactively to historical macro data. Regime signals are reconstructed from FRED series (DFF, PCE, HY spread, TIPS real rate, Chicago PMI proxy, GDP) and yfinance market data (VIX, SPY momentum, yield curve). Publication lags are applied: GDP offset 45 days, PCE/CPI offset 30 days, ISM/Fed offset 2–5 days. Cash earns 0% (no T-bill return modeled). Transaction costs and taxes are not modeled. URNM data availability begins Dec 2019; BTC data is from BTC-USD (not MSTR, which has shorter history). This is an illustrative model — not investment advice.

Advisory only. No live trading. All values are model positions.
